Abstract

The complexity of contemporary finance translates into what we call the problem of “description”: the problem of constructing robust, flexible, portable, and mutually compatible depictions of complex, multisided, and often ambiguous financial objects (products, trades, marketplaces). This problem is characteristically exacerbated in back-office operations within the financial services industry. We provide a case study in the form of a qualitative examination of back- and middle-office operations in an international investment bank. We analyze the manifold manifestations of the problem of description within this bank.
