**Published:** 03 March 2012

## Abstract

Firms that intentionally increase leverage through substantial debt issuances do so primarily as a response to operating needs rather than a desire to make a large equity payout. Subsequent debt reductions are neither rapid, nor the result of proactive attempts to rebalance the firm's capital structure toward a long-run target. Instead, the evolution of the firm's leverage ratio depends primarily on whether or not the firm produces a financial surplus. In fact, firms that generate subsequent deficits tend to cover these deficits predominantly with *more* debt even though they exhibit leverage ratios that are well above estimated target levels. Our findings are broadly consistent with a capital structure theory in which financial flexibility, in the form of unused debt capacity, plays an important role in capital structure choices.
