Abstract

We construct a framework for measuring economic activity at high frequency, potentially in real time. We use a variety of stock and flow data observed at mixed frequencies (including very high frequencies), and we use a dynamic factor model that permits exact filtering. We illustrate the framework in a prototype empirical example and a simulation study calibrated to the example.

Keywords: :

Business cycle

Contraction

Dynamic factor model

Expansion

Macroeconomic forecasting

Recession

State space model

Turning point
