Abstract

Executives confront potentially conflicting pressures—maximizing shareholder wealth in the long term and appearing shareholders in the near term. Because they must address near-term pressures to preserve tenure and to realize the benefits of long-term strategies, executives are increasingly likely to seek to mollify shareholders. We develop a behavioral-agency theoretical framework for studying how stock repurchase programs are used to help top managers appears shareholders. Analysts of 250 large U.S. firms suggested that stock repurchase programs are variously a function of information asymmetry, risky stock-based incentives, and performance expectations.
