Abstract

We examine the determinants of international commercial real estate investment using a unique set of panel data series for 47 countries worldwide, covering the period from 2000 to 2009. We explore how different socio-economic, demographic and institutional characteristics affect commercial real estate investment activity by determining both cross-sectional and time-series estimators, running augmented random effect panel regressions. We provide evidence that economic growth, rapid urbanization and compelling demographics attract real estate investment, and also demonstrate that a lack of transparency in the legal framework, administrative burdens of doing real estate business, socio-cultural challenges and political instabilities reduce international real estate allocations.

Notes

1. Dunning ([1977](#), [1980](#), [1981](#), [1995](#), [2000](#), [2001](#) and [2006](#)).
2. The detailed correlation matrix can be provided on request.
3. Please note that a high inflation rate is unattractive for investment activity. The previous rescaling of the raw-data leads to the positive sign of the “inflation” estimators.
4. Please note that a high tax rate is unattractive for investment activity. The previous rescaling of the raw-data leads to opposite signs of the “tax rate” estimators.
5. Lee ([2006](#)) uses property returns from the Investment Property Database (IPD).
