Abstract

Identity is fundamental in finance: to protect against fraud and crime, to fulfil know-your-customer obligations, and to ensure market integrity. At the same time, identification and know-your-customer rules can be major barriers to accessing financial services. This paper considers the various requirements for identification in the financial sector and the evolving nature of identity. We argue that technology presents an opportunity to solve this challenge through the development of digital identity infrastructure and related utilities. The establishment of such utilities requires addressing design questions such as

registration methods, data availability, and cross-jurisdiction recognitions. Yet, as with any reform, a balance between flow through efficiency and cyber-security needs to be reached to ensure that the objectives of financial inclusion and market integrity are not achieved to the detriment of financial stability.
