Abstract

One issue in the debate over the origins and dynamics of the North Atlantic Financial Crisis (or NAFC) and its wider but uneven contagion effects is the significance of financialisation. While this is sometimes discussed in terms of a conflict between the ‘real economy’ and the financial economy (for example, Main Street versus Wall Street, Industry versus the City), this is misleading because the real economy in capitalism inevitably depends on monetary and financial intermediation. The opposition, if it exists, must arise elsewhere. One approach reinterprets this conflict directly in terms of the economic and political sociology of different fractions of capital, their social bases, material and ideal interests, and

relation to political society and the state. This approach is explicit in Geoff Ingham's 1984 study of the City of London and industrial capital in Britain. Another approach addresses the conflict indirectly in terms of the changing articulation of the forms, functions, and hierarchies of money and how they operate both separately and together in (dis)connecting the circuits of capital in the world market. This articulation operates behind the backs of economic agents, potentially disrupting the best-laid plans of different fractions, with different outcomes in different periods. This is implicit in Geoff Ingham's work on money as a social relation, its changing role in financing state activities and entrepreneurial innovation, its role in power struggles and economic conflicts, and the role of credit-money in the recent crisis (Ingham 2004, 2011).
