Abstract

This paper investigates the financial characteristics of the population of listed Singaporean companies receiving first-time qualified audit reports. It develops and tests hypotheses which take into account the costly contracting implications of a qualification for both the auditor and client. A matched pair design is used as a control. Results show that firms receiving qualified reports are significantly less profitable and liquid and have significantly more debt than the control in the year of qualification. Profitability and liquidity are shown to have declined in the four-year period up to the qualification, while debt levels have increased.

assets or changed accounting methods. It is more likely that a qualified report will be issued by a “non Big 8” auditor in Singapore to a firm which has a higher proportion of the equity owned by the management. Qualified firms are more likely to have revalued assets and changed accounting methods to increase income than the control group. The strength of the results is also shown to depend on the nature of the qualification. Companies receiving “severe” qualifications (ie going concern, not true and fair, and unable to form an opinion) have far more significant differences than their pairs compared with those firms receiving “moderate” or “other” qualifications.
