Abstract

To estimate the monetary value of ideal financial planning advice, we address three types of benefits that planners provide: increasing wealth, preventing loss, and smoothing consumption. We discuss, then reject the possibility of using survey data to obtain valid estimates of the benefit of financial planning advice. We instead use theoretical examples based on comparisons of optimal decisions to naive alternatives. We find that the value of advice varies with a client's risk aversion and the percentage of wealth that could be gained or lost. In general, the most risk averse households should place the highest value on comprehensive financial planning advice. Financial planners can use our results to better articulate the value of advice.

Joint life annuities and annuity demand by married couples
We use data from the Survey of Consumer Finances to analyze the demand for joint life annuities. We find that the demand for joint life annuities is significantly higher for married couples than for single individuals. We also find that the demand for joint life annuities is higher for couples with higher wealth and higher income.
