Abstract

Past research has revealed significant abnormal ex-date returns for stock dividends even though the ex-date is known in advance and the distribution contains no new information. Various researchers have suggested that odd-lot transaction costs faced by certain investors are the key driver in the abnormal returns. However, no study to date has directly compared the ex-date price reaction of stock dividends distributed when odd-lot trade costs were charged to those issued when odd-lot costs were not evident. A further tax-based argument has also been put forward to explain the price reaction to stock dividends when those dividends carry imputation tax credits. New Zealand stock dividends present a unique opportunity to directly test the odd-lot cost argument as well as examine the impact of New Zealand's imputation tax regime on stock dividend ex-dates. We find evidence to support the odd-lot transactions cost argument and also show that imputation tax credits have a value greater than zero.
