Abstract

Retailers and restaurants can grow revenues either by building new locations or by increasing sales at existing locations. Same-store sales growth is considered to be a more reliable indicator of firm performance than sales growth through new locations, but investors may not always differentiate between the two types of revenue growth, generating predictability in returns. I show that same-store sales growth forecasts equity returns in the cross-section, that it generates significant spreads in portfolio alphas, and that it forecasts future return-on-assets.
