Abstract

The banking literature suggests that the low performance of the banking sector can spread to real economic activities, especially small businesses. Many previous studies insist that the Japanese experience of the 1990s supports this argument. However, many studies of small businesses are often

report no worsening in the lending attitude of financial institutions in the so-called credit crunch period of 1998–1999 (or even in the 2000–2001 period). Second, using detailed firm level panel data from the Credit Risk Database, we find no significant reductions in the loans for the majority of small businesses. Third, while we do find evidence that bank-dependent firms increased reliance on internal funds during the period of the credit crunch (1998–2001), we find no evidence that this negatively impacted firm performance (as reflected in firm growth and profitability measures).
