We examine variations in the impact of several components of economic hardship on the 2008 presidential vote by county. High gas prices, mounting foreclosures, and rising unemployment all enhance the Democratic vote share in areas critical to winning an Electoral College majority. Using Geographically Weighted Regression (GWR), however, we show the varying impact of these forces, controlling for previous Democratic voting, race, age, and income. Economic problems do not produce anything like a uniform response, and not merely because they are
