Financial status, corporate governance quality, and the likelihood of managers using discretionary accruals

Abstract

Purpose

The purpose of this paper is to investigate, using data on US manufacturing firms, how and when corporate governance affects managers' decisions to use discretionary accruals and thereby artificially influence company financial reports.

Design/methodology/approach

Three-stage least squares is employed to study the relationship between financial status, corporate governance and financial reporting discretion. The sample spans the years 2001-2003 during a severe downturn in the US stock market. Financial status is measured with the Altman Z-score.

Findings

A significant difference is found between firms not classified as healthy or failed (i.e. the mid-range group) and the two extreme categories when examining governance quotient using a well-known index. A positive relationship is found between discretionary accruals and the governance index. Strong governance appears to reduce the incidence of midrange firms engaging in accruals management. The least healthy and the most distressed companies have the weakest relationship with discretionary accruals. By contrast, mid-range firms are more likely to resort to discretionary accruals.

The relationship between firms' financial health and discretionary accruals reveals an agency problem in credit markets with financially stressed firms. More attention is required on firms whose financial condition is uncertain. Also, it is documented that significant findings of importance to the earnings quality and corporate governance literature by documenting the role of corporate governance on discretionary accruals and financial status.
