Abstract

Conceptions of the transition to adulthood in the contemporary American majority culture are examined, and compared to conceptions cross-culturally and historically. Perspectives from other places and times are presented first, indicating that there is a widespread view that the transition to adulthood involves the gradual development of character qualities such as impulse control and diligence but culminates in marriage as the ultimate marker of the transition to adulthood. Findings from several recent American studies are then presented, indicating that for contemporary young Americans the preeminent criteria for the transition to adulthood are the individualistic character qualities of accepting responsibility for one's self and making independent decisions, along with becoming financially independent; marriage, in contrast, ranks very low. New data are presented to illustrate young Americans' conceptions of the transition to adulthood. Reasons are discussed for the prominence of individualistic criteria in American society and the prominence of marriage in other places and times. The concept of emerging adulthood is presented as a new way of conceptualizing the period between adolescence and young adulthood.

Drug Dosage: The authors and the publisher have exerted every effort to ensure that drug selection and dosage set forth in this text are in accord with current recommendations and practice at the time of publication. However, in view of ongoing research, changes in government regulations, and the constant flow of information relating to drug therapy and drug reactions, the reader is urged to check the package insert for each drug for any changes in indications and dosage and for added warnings and precautions. This is particularly important when the recommended agent is a new and/or infrequently employed drug.
