The US Current Account Deficit and Economic Development: Collateral for a Total Return Swap

Michael P. Dooley, David Folkerts-Landau & Peter M. Garber

WORKING PAPER 10727

DOI 10.3386/w10727

ISSUE DATE September 2004

We argue that a chronic US current account deficit is an integral and sustainable feature of a successful international monetary system. The US deficit supplies international collateral to the periphery. International collateral in turn supports two-way trade in financial assets that liberates capital formation in poor countries from inefficient domestic financial markets. The implicit international contract is analogous to a total return swap in

domestic financial markets. Using market-determined collateral arrangements from these transactions we compute the collateral requirements consistent with recent foreign direct investment in China. The data are remarkably consistent with such calculations. The analysis helps explain why net capital flows from poor to rich countries and recent evidence that net outflows of capital are associated with relatively high growth rates in

emerging markets. It also clarifies the role of the reserve currency in the system.
