We Care About Your Privacy

We and our 855 partners store and access personal data, like browsing data or unique identifiers, on your device. Selecting "I Accept" enables tracking technologies to support the purposes shown under "we and our partners process data to provide," whereas selecting "Reject All" or withdrawing your consent will disable them. If trackers are disabled, some content and ads you see may not be as relevant to you. You can resurface this menu to change your choices or withdraw consent at any time by clicking the ["privacy preferences"] link on the bottom of the webpage [or the floating icon on the bottom-left of the webpage, if applicable]. Your choices will have effect within our Website. For more details, refer to our Privacy Policy. [Here](#)

Notes

An alternative measure calculated as the ratio of liquid liability to GDP was also used in this study. Results are similar to those reported here and are available upon request from the authors.

The sample period for the data, 1962–1998, covered two oil-price shocks and the economic liberalization in Taiwan, so structural breaks are expected for the data series studied.

Regarding the KPSS test, Lee et al. ([1997](#)) also show that the test suffers from a size distortion problem if a structural break exists but is ignored. The problem parallels the power loss problem of unit root tests when an existing break is ignored.

When the coefficients of both dummy variables are not significantly different from zero, Model C reduces to the standard ADF equation.

Using Monte Carlo simulations, Cheung and Lai ([1993](#)) showed that for autoregressive processes, standard selection criteria, like the SIC and Akaike Information Criterion (AIC), can be useful for selecting the correct lag structure for the Johansen's cointegration test. They found that the SIC performs slightly better than the AIC.
