Notes

¹ See also HM Treasury ([2004](#), pp. A145–8, pp. 38–9).

² Further critical insights are provided by behavioural finance (Kahneman and Tversky, [1979](#); Kahneman and Riepe, [1998](#); Frankfurter and McGoun, [1999](#); Marzo, [2002](#)), and by other influential theoretical works (Laibson, [1997](#); Loewenstein and Thaler, [1989](#); Loewenstein and Drazen, [1992](#); Cropper and Laibson, 1999; Weitzman, [2001](#)). Ainslie ([1992](#)) stressed hyperbolic (simple interest) computation for inter-temporal valuation, referring to the seminal work of Herrnstein ([1961](#)) that Mazur ([1986](#)) and Ainslie ([1992](#)) further refine and formalize. Shane et al. ([2002](#)) provided a review of the economic literature on the matter.

³ They may be interpreted as the opportunity cost of capital.

⁴ Biondi

⁵ Baker et al.

⁶ For example, the Office of General Counsel (OGC), PriceWaterhouseCoopers (PwC) and other projects relative to the Cost of Capital (CoC) conclusion of the swap contracts and other projects.

⁷ That is

⁸ NPV and IRR are calculated using the same discount rate, while the IRR approach assumes that it is the same rate as in IRR. Thus, the generalized

approach vindicates the return-based measures like IRR and theoretically unifies discounted values and discounted rates of return.

⁹ For instance, Rubinstein ([2000](#)) suggests a function where the discount factor f_t is decreasing in t , and increasing in a_t (the larger the sum of money at stake, the higher (closer to 1) the discount factor). He suggests a procedural rationality approach, framed with nonexpected utility theory. See also the references provided by the note 2. A framework for this kind of normative economics is suggested by Sugden ([2004](#)).

¹⁰ We assume here that the rate of reference for discounting is the investment rate. IRR over (under) evaluates investment projects with high (low) rates of return.

¹¹ Usual relation between GIRR, Generalized Net Future Value (GNFV) and Generalized Net Present Value (GNPV) applies: GIRR is the discount rate that makes both GNFV and GNPV equal to zero.

¹² Of course, a change in the replacement rate modifies the project's GIRR, but it does not modify its comparative ranking.

¹³ Drawing upon Biondi ([2006](#)), Sampaio Filho (2008) and Kierulff ([2008](#)) provide further reviews of literature.

¹⁴ The EOD relates to the temporal evolution of the GIRRs period by period. Sufficient condition for the EOD to be satisfied is that the sum of the discounted net cash flows is positive and in the case of strictly positive net cash flows, the EOD is satisfied if the sum of the discounted net cash flows is positive and the sum of the discounted net cash flows is positive. If each annual investment is strictly positive, the EOD is satisfied.

¹⁵ Reference is made to the work of Kvasov and Kvasov ([2005](#)) who use a similar approach through the use of the EOD.

¹⁶ That is, the EOD is satisfied if the sum of the discounted net cash flows is positive and the sum of the discounted net cash flows is positive.

¹⁷ At the same time, the government is facing public debt, increasing insurance liabilities and security liabilities to service the government debt.

¹⁸ In general, a replacement rate of 4.5% will reduce the optimal duration of 1–2 years under GIRR and SIRR, while it obviously does not affect the optimal duration under the BIRR.

¹⁹ This document refers to the IRRs as part of those processes and negotiations.

²⁰ That is accrued income and cumulated inflows from replacement.

²¹ According to the sole replacement structure, the weights attributed to preceding inflows are more relevant under IRR than GIRR, than SIRR, than finally BIRR.

²² Each score makes the compound cumulated returns of the initial outflow (investment) equal to the cumulated cash flows including replacements.

²³ We assume here that the generalized future value from the project (cash earnings) and the cash outflows for the project (investment) are discounted at the same compound rate i . This assumption may be released by taking three different rates: one for financing (related to cash outflows), one for investing (the risk-adjusted discount rate of the investment), one for replacement (related to cash inflows). In fact, concerning the discounting of sources of financing, we should consider a Generalized Weighted Average Cost of Capital (G-WACC) based on the target capital and target financial temporal structures, since equity finances (compound interest as reference) usually have not the same temporal structure as debt finances (simple interest as reference).
