ABSTRACT

Cryptocurrencies are one of the most promising financial innovations of the last decade.

We Care About Your Privacy

We and our 842 partners store and/or access information on a device, such as unique IDs in cookies to process personal data. You may accept or manage your choices by clicking below, including your right to object where legitimate interest is used, or at any time in the privacy policy page. These choices will be signaled to our partners and will not affect browsing data. [Privacy Policy](#)

We and our partners process data to provide:

Use precise geolocation data. Actively scan device characteristics for identification. Store and/or access information on a device. Personalised advertising and content, advertising and content measurement, audience research and services development.

Show Purpose

independent, and cross tail independent with four selected stock indices, which implies

part of the safe-haven function of the cryptocurrencies, indicating their ability to be a great diversifier for the stock market as gold, but not enough to be a tail hedging tool like gold.

KEYWORDS: Cryptocurrency tail risk tail correlation diversification hedge

⁵ We use $\ln(T)$ (where T is the length of the time series) as the lag of Ljung-Box tests, which is suggested by Tsay ([2005](#)) and followed by other papers (For example, Fang and Miller [2007](#)). We use $\text{lag} = 1$ and $\text{lag} = 6$ for Engle tests of ARCH effect. In the literature, researchers usually choose 2 or 3 different (low order) lags to see if ARCH effect exists (for example, Engle [1982](#)).

⁶ A further test suggests that this autocorrelation cannot be removed by purely using ARMA, and we have to divide the sample into two or more sub-periods and then use ARMA to remove this autocorrelation for extreme value analysis to be applied. For all the cryptocurrencies, we use 03/01/2017 as a breakpoint; for Ripple, we use 05/01/2017 as another breakpoint, to fit the ARMA-GARCH model and get the pseudo return.

⁷ We can prove that when $Z > z_q$, and under the assumption of GPD, we have $E[Z|Z > z_q] = z_q + \sigma - \xi u^{1-\xi}$.

⁸ The left tail distributions of the four stock indices (S&P 500, Euro Stoxx 50, Nikkei 225, CSI 300) are estimated to be Fréchet type (long tails) during the sample period, and the two commodities (Gold PM Fixing and WTI Crude oil Indices) are estimated to be Weibull type tails (truncated tail distribution), so conditional extremal boundaries only apply to the two commodities.
