Abstract

In this study, we investigate a continuous review inventory model to reduce lead time, yield variability and setup cost simultaneously through capital investments. We assume that the backorder rate is depending on the length of the lead time through the amount of shortages. We also assume that lead time demand's distribution is not known but its first and second moments are known. We apply minimax distribution free procedure to minimise the expected total annual cost. By using logarithmic investment function we describe the effect of investment on the inventory system. The numerical results show that the cost with investment is lower than the cost without investment. Our main aim is to show that the investment in the inventory system is given. With the investment, the inventory system is given. The policies are proposed by Lin and Hou (2002), Lin (2003) and Lin and Hou (2002). In the above model, yield variability and setup cost were reduced

through capital investment. In our model we reduce yield variability setup cost and also the lead time, which plays a vital role in any business. By reducing lead time we can improve the service level to the customer so as to increase the competitive edge in business. (2) In the model (the model by Lin and Hou ([2005](#))), it was assumed that lead time demand follows normal distribution. But in our model we take the distribution of lead time demand as distribution free. That is, it can follow any distribution which is more general. (3) In the above model (the model by Lin and Hou ([2005](#))), shortages are completely backlogged. But we consider partial backlogging and take the backlogging rate as $0 \leq B \leq 1$. If we set backlogging rate $B = 1$ we get the above model. That is, the above model is particular case of our model. (4) We also assume that the backorder rate depends on the length of the lead time through the amount of shortages. If the lead time is longer then shortage accumulation is higher. The patience of customers will result in failure in business since some customers may turn to some other supplier. Hence, the backorder rate will be reduced. This assumption is very realistic.
