Show Purpose

that the macroeconomic management of aid inflows in Africa has been significantly better than often portrayed in comparable exercises. The implication is that African countries will be able to efficiently manage a gradual scaling up in aid resources.

Acknowledgements

This article was written when the author was a doctoral researcher at the Institute of Development Studies, Brighton, UK. He would like to thank the financial support provided by the Fundação para a Ciência e a Tecnologia.

Notes

- 1 This approach may also have its limitations, as recipients may under-report the total amount of aid. Nonetheless, we still believe that this data is superior to the data reported by donors.
 - 2 These were embedded in the 2002 Monterrey Consensus – an outcome of the United Nations International Conference on Financing for Development – and the 2005 Gleneagles G8 summit.
 - 3 For a useful review of this literature see McGillivray and Morrissey ([2001](#)).

ssional

8 Not surprisingly, the full sample shows lower absolute averages and higher standard deviations for the aid variables.

9 The robust versions of the Breitung and Hadri tests are implemented by the new STATA command 'xtunitroot.' See also Breitung (2000) and Hadri (2000).

10 The LLC and IPS tests require N to be relatively smaller than T, which is not the case here.

11 For each time period, the mean of the series (across panels) is calculated and then subtracted from the observations.

12 The PMG methodology, for example, requires that foreign aid is exogenous. This may not constitute a major concern since our aid variable only includes aid grants. Aid loans (such as IMF lending) tend to be more responsive to domestic conditions (for example, balance of payments crisis and fiscal imbalances).

13 There might be concerns of reverse causality (for example, higher fiscal deficits causing higher inflation), since only the first two methodologies provide corrections for endogeneity. However, an increase in the non-aid fiscal deficit does not necessarily translate into an increase in money supply. It can be covered by the additional aid inflow, which appears to be the case. Moreover, the coefficients are almost identical to those from SYS-GMM.

14 The two long-run coefficients of the explanatory variables are now allowed to vary, that is, $(25-1)*2 = 48$.
