BEAVERSTOCK J. V., HALL S. y WAINWRIGHT T. Servicios para los super ricos: nuevas elites financieras y el crecimiento de la ecología minorista en la gestión de patrimonio privado, *Regional Studies*. El creciente vínculo entre la vida diaria de las personas y el sistema financiero internacional es un tema ampliamente analizado en los estudios sobre financialización. Sin embargo, se ha prestado mucha menos atención al modo en que las elites financieras consumen servicios financieros. Por este motivo, en este estudio combinamos la investigación sobre elites financieras con la de ecologías financieras minoristas para entender el sector de la gestión de patrimonio privado que se ha desarrollado para servir a estas elites financieras. Basándonos en la investigación original sobre empresas de gestión de patrimonio privado, sostenemos que es importante examinar el desarrollo y la naturaleza de esta nueva ecología financiera para comprender la financialización y su geografía desigual.

financial system (LEYSHON et al., [1998](#)). The growth of financial products such as individual savings accounts (ISAs), different types of mortgage finance and unit trust portfolios, and the increasing use of the stock market in providing pension provision, are indicative of such developments (CLARK et al., [2009](#)). Furthermore, work on financial inclusion and exclusion has demonstrated the consequences of this changing relationship between individuals and the international financial system by highlighting the differential ability of individuals to enter financial services networks (LEYSHON and THRIFT, [1997](#)).

However, whilst this research has highlighted how the changing nature of retail financial services has differentially impacted on individual's everyday lives, only certain types of individuals have been studied. In particular, whilst much has been made of the financial exclusion of lower socio-economic groups, the ways in which higher socio-economic groups are tied into the international financial system through their financial consumption practices have been virtually entirely neglected. In response, this paper examines the changing relationship between new forms of financial elites and retail financial services. It defines new financial elites as investment bankers, corporate lawyers, senior employees in finance-related advanced producer and professional service firms, and private equity and hedge fund partners who have played a significant role in shaping processes of financialization (FOLKMAN et al., [2007](#)). As a result of this work, they have enjoyed significant personal remuneration, linking their salary

one of the preeminent clusters of such firms (INTERNATIONAL FINANCIAL SERVICES LONDON (IFSL), 2009) and, by virtue of the transnational nature of its contemporary financial labour market, investors with a multitude of expertise and competencies, and of many nationalities, have the potential to service a global client base with a 'home bias' in London's global financial markets. The importance of 'home bias' – the behaviour of intermediaries to allocate investment to domestic rather than foreign markets (DUPUY et al., 2010; GROTE, 2007) – cannot be underestimated in contributing to London's preeminent position in the global private wealth management industry. Indeed, as with other financial centres, such intermediaries can draw upon the critical mass and agglomeration advantages of London's financial community, in the form of access to expert labour (such as investment banks, corporate lawyers, accountants), interpersonal networks and regulators in order to use these locally based geographical assets to inform further 'home bias' in investment behaviour (also WÓJCIK, 2007, 2009; WÓJCIK and BURGER, 2010).

The arguments bring two literatures that have largely developed in parallel to one another into dialogue. First, work on the changing nature of the global 'super-rich' has documented the changing sources of wealth held by these economic elites (BEAVERSTOCK et al., 2004). This literature stresses the shift away from a reliance on inherited and establishment forms of familial wealth to 'new' forms of wealth associated with changing executive remuneration patterns in all corporate sectors of economy, but especial work has acknowledged the transnational nature of the global super-rich class, its financial services and geographical mobility. This literature has also examined how different socio-economic groups (and their geographical locations) are used to examine how wealth is accumulated (geography) and how it is managed (paper). This paper provides a critical analysis of the services provided by these firms, and aims to examine how these firms, which are aimed at providing services to a private and retail wealth management industry, are part of the financial system.

[2004](#)). This literature has compared relatively vibrant middle-class suburban ecologies populated by financially literate individuals and 'relic' retail financial ecologies characterized by service withdrawal, typically found in poor inner cities and peripheral local authority housing estates. However, retail financial services aimed at high-income earners have been entirely neglected to date. Moreover, by focusing on the technologies that are used to stratify and manage customers within the private wealth management ecology, it is demonstrated how the geographical variation of different ecologies is reproduced through the governance techniques of financial service providers themselves. Understanding the growth of wealth management ecologies in this way is valuable in developing understandings of the multifaceted nature of financialization and everyday life, and its uneven socio-geographic consequences.

This argument is developed over five sections. The next section explores how work on financial elites, retail financial ecologies and financial consumption practices can be combined to develop understandings of the ways in which these individuals are tied into retail financial services provision. Next, the growth of the private wealth management industry is identified, focusing on the technologies developed to segment this industry by both income and geography. The fourth and fifth sections document the geographical and organizational variation in high net-worth (HNW) retail financial ecologies by presenting original empirical research into private wealth management ecologies in the United Kingdom. Finally, the paper concludes by considering the implications for financial elites and

derived through the inheritance of assets by the younger members of industrial families or through inheriting the wealth of the landed gentry, synonymous with the label of 'old' money (HASSLER, [1999](#); LUNDBERG, [1988](#)). However, more recently financial elites are formed less by virtue of their educational and social background, and increasingly through their working practices. Most notably, as individuals working in finance and related advanced producer services have developed new financialized products in the 2000s, they have benefited personally in terms of a significant bonus culture and enhanced basic remuneration (JONES, [2003](#)). As the think-tank IFSL ([2009](#)) has argued,

The main source of growth in private wealth originates from those involved in building successful businesses ... senior executives in large companies, who have substantial earnings supplemented by stock options and other bonuses; entrepreneurs that have become millionaires from successful flotations and IPOs [initial public offerings]; and other individuals that have received the proceeds from selling to larger international groups.

(p. 3)

Whilst the exact number of such financial elites and their associated investable assets are hard to estimate, not least because of the changing membership of this group in the run up to, and following, the financial crisis, the MERRILL LYNCH /CAPGEMINI (MLCG) World Wealth Report 2007 (2008) argued that the HNW population (which comprises these

financial assets of more than

This shift in the composition of assets is related to work and bonuses are determined by social and commercial factors. The 'super-rich' (BEAVERSTOCK, 2001, 63% of European assets with 79% of North American assets continued through

Table  
asset

Download

In addition to wealth generated through financial and related advanced producer services, the wealth of global 'super-rich' is derived from what is known as a 'liquidity event' (SMITH, [2001](#)) where entrepreneurs, or the owners of a family business, sell all - or part - of their business through an IPO, increasing their wealth, almost literally overnight. The rise of these 'new' forms of wealth has grown steadily, and while these developments are more pronounced in the United States, this trend is also present in the UK with 'self-made multi-millionaires and millionaires' (THE SUNDAY TIMES, various years). Indeed, academic work on the global 'super-rich' has explored the changing geographical locations of their main residence. In this respect, at a global level the dominance of Europe and North America has increasingly been challenged by the growth of new financial elites found in emerging markets, notably the Middle East and South East Asia, reflecting a wider shift in financial power from West to East in the wake of the financial crisis (AALBERS, [2009](#); FORBES, [2009](#); THE SUNDAY TIMES, various years; MLCG, various years). Meanwhile, research has also pointed to the continued concentration of new financial elites, in particular sub-national regions such as London and the South East in the case of the UK, where the banking, finance and professional services which are important in creating new financial elites are clustered (BEAVERSTOCK, [1996](#)).

However, the emergence of this 'new' money does not spell the end of inherited wealth in the UK. The wealth of landowners in the UK is far from being insignificant (IRVIN, [2008](#)), as the case of the landed wealth of the Duke of Westminster (the richest landed

who had accumulated their personal wealth through 'old' money sources such as inheritance, property, land ownership, and manufacturing and extractive dynasties (HASSLER, [1999](#); IRVIN, [2008](#)) (Table 2). This began to change in the 1980s when many high-street retail banks began to offer private banking and premier accounts to a burgeoning 'new service and middle class'. However, the most significant changes followed the deregulation of financial markets from the mid-1980s onwards in the City of London that led to the rapid growth of a 'pure' private wealth management industry. This growth involved a range of multinational corporations, small and medium-sized financial and professional service providers, as well as established private banks (for example, Wachovia) and the private banking arms of many global banks, most notably by competitors from the United States like Bankers Trust, Chase Manhattan, Citicorp and Merrill Lynch (BICKER, [1996](#); FRANK, [2007](#)). Moreover, such institutions increasingly began to manage such investable assets from the 'offshore' jurisdictions of Switzerland, Luxembourg, the Channel Islands, the Isle of Mann, Hong Kong and the Caribbean (for example, the Cayman Islands) (MAUDE and MOLYNEUX, [1996](#)).

only meet their outstanding obligations, but who entrepreneurially manage and manipulate those obligations to maximize their freedom and security. (p. 1410)

Given the profitability that retail financial firms saw from transforming new financial elites into wealth management customers, their services moved away from the 'traditional', established, private banking business model that revolved around deposit taking and payments, limited asset management and tax advice, and brokerage, offered by a 'single designated relationship manager'. Rather, the newly emerging wealth management industry can be defined by its financialized business model in which it provides financial advice not only to protect investments, but also to accumulate, grow and transfer wealth between generations. Indeed, it has developed in order to service a higher-volume customer base who, following processes of neo-liberalization and financialization, are encouraged both to take and manage risks by tying their investments more closely into the international financial system in order to secure higher rates of return. As a result, an industry once dominated by private banks and 'family-connected' stockbrokers is now a significant global industry spanning banking, financial services, insurance, real estate (property) and traditional professional services (accounting, legal), with many, if not all, of the global financial and professional service firms highly active in this market both 'onshore' and 'offshore' (MAUDE, 2006, pp. 1-2; BICKER, 1996).

significant players in the market.

- Trust banks (US private banks) that mainly target so-called ultra-HNWIs (UHNWIs; the definition of which is discussed below).
- Universal and retail banks that target the MA and HNWIs from their existing clientele and portfolio of business.
- Investment banks that target UHNWIs.
- Family offices that serve the wealthiest and top-tier billionaires in the US (about 4000 families) and Europe (about 500 families).
- Financial advisors serving both HNWIs and the MA.
- Stockbrokers.
- Asset managers.
- Product specialists (for example, hedge fund providers).
- Insurance and other professional services who target HNWIs and the MA.

Banks (as listed above) are the most significant players in this market for private wealth management, which still retain their private banking function (Table 3).

shape these ecologies. In response, this paper focuses on two technologies that have played an important role in shaping the development of the wealth management ecology (investable asset classification and geographical differentiation) in order to understand not only the geographically variegated nature of wealth management ecologies, but also how this variegation emerges from the use of such technologies. Using this approach, what follows explores the development of one case study private wealth management ecology found in the UK centred on London and the South East of England. This case study is valuable because in addition to being one of the most important such onshore clusters globally for wealth management, where intermediaries have the opportunity to benefit from close geographic 'home bias' in investment behaviour in a global financial marketplace (as outlined by DUPUY et al., 2010; WÓJCIK, 2007, 2009), alongside New York, Singapore and Hong Kong (IFSL, 2009), it is also intrinsically international in nature given the international financial elite labour markets that it services.

## PRIVATE WEALTH MANAGEMENT MARKET TECHNOLOGIES AND THE NATURE OF THE HIGH NET-WORTH FINANCIAL ELITE

The development of private wealth management ecologies has relied on two related 'technologies' that have shaped the nature of the high net-worth financial elite amongst different levels of wealth management ecologies. The first is the technology of geographical differentiation of wealth management ecologies, which has led to the emergence of different levels of wealth management ecologies. The second is the technology of investment management, which has led to the emergence of different levels of wealth management ecologies. The development of private wealth management ecologies has relied on two related 'technologies' that have shaped the nature of the high net-worth financial elite amongst different levels of wealth management ecologies. The first is the technology of geographical differentiation of wealth management ecologies, which has led to the emergence of different levels of wealth management ecologies. The second is the technology of investment management, which has led to the emergence of different levels of wealth management ecologies.

HNWIs are defined as those having investable assets of US\$1 million or more, excluding primary residence, collectables, consumables, and consumable durables;

Ultra-HNWIs are defined as those having investable assets of US\$30 million or more, excluding primary residence, collectables, consumables, and consumer durables;

Mid-tier millionaires are HNWIs having US\$5 million to US\$30 million.  
(MLCG, 2009, p. 2)

Building upon this wealth classification, many private wealth management providers themselves have refined their own definitions of the wealthy for internal purposes. For example, PRICEWATERHOUSECOOPERS (2009) have defined their own wealth pyramid, defined in US dollars, in five descending bands:

- UHNWIs worth more than US\$50 million.
- Very HNWIs (VHNWIs) worth between US\$5 million and US\$50 million.
- HNWIs worth between US\$1 million and US\$5 million.
- Wealthy worth between US\$500 000 and US\$1 million.
- Affluent worth between US\$100 000 and US\$500 000.

Two common denominators categorize these definitions of private wealth. First, wealth

is defined in ways in which reflect the potential for their creation of US\$1 million or more to what net worth market the industry reflects the debate as 'very high' particular empirically for management

GEOGRAPHIC WEALTH INDIVIDUALS WITH

The use of geography as a 'technology' to shape the nature of the private wealth management industry echoes work on retail financial services ecologies more widely that have pointed to significant geographical variation in the nature of financial services provision (LEYSHON et al., [2004](#)). This technology is used at global, regional and sub-national levels to assess the relative potential to develop wealth management products and tailor them to the different investable asset classes found in different locations. It also allows products to be changed as different geographical markets experience periods of economic growth and retrenchment at different times, something that has become particularly important in the wake of the global financial crisis. At a global level, North America and Europe have consistently accounted for the highest absolute and relative (percentage share) of the number of HNWIs, and the value of private wealth worldwide (by an average relative margin of about two-thirds of each total) since the inception of the MLCG Global Wealth Surveys. For example, in 2008 North America and Europe accounted for the highest shares of both the total number of HNWIs and UHNWIs (62%), and the distribution of private wealth (53%) (MLCG, [2009](#)). Meanwhile, data from Forbes' billionaire list reveals that the United States had the highest share of billionaires and millionaires in 2008 (460 billionaires and 4,884 millionaires, representing 41% and 46% of the total share respectively) (IFSL, [2008](#)). At the world city scale, New York is home to the most billionaires (fifty-five) on the Forbes list, followed by London (twenty-eight) and Moscow (twenty-seven) (FORBES, [2009](#)).

However, the geographical pattern of private wealth management has changed significantly since 2008, with a decline of -19.0%

pattern of result of the ls and value this period

Table in

Download

These changes have resulted in significant Latin America (China and India)

Latin America and India)

example, in 2008 China's HNWI population, calculated at 364 000, exceeded the UK for the first time (362 000) and was ranked in fourth place behind the United States (first at 2.64 million), Japan (second at 1.366 million) and Germany (third at 810 000) (MLCG, [2009](#)). Between 2006 and 2008, India (+27%), China (+20.3%), Brazil (+19.1%) and South Korea (+18.9%) had the highest relative growth in the HNWI population at the state level (MLCG, [2008](#)).

### Table 5. Changing geographical coverage of high net-worth individual (HNWI) and private wealth, 2002–2007

Download CSV

Display Table

Given this global pattern and the leading role of London within the international financial system, it is not surprising that the UK has become an international centre for both HNWIs and an associated wealth management industry. However, and echoing the importance of financial services and related professional services in creating HNWIs, the geographical distribution of such individuals and their financial ecologies are not even across the UK. For example, a UK regional analysis of the distribution of The Sunday Times Rich Lists ([2002–2009](#)) shows that London and the South East has averaged 51% of the top 1000 HNWIs who were born, live or have their interests centred in these regions.

emerging organization architecture of this financial ecology, rather than on the investment behaviour, whether 'home' or 'international', of the intermediaries who manage the wealth of these HNWIs. Therefore, the authors cannot draw substantive conclusions regarding the 'home bias' of the investment portfolio and management of these bespoke financial products. But, first, it is important briefly to introduce the methodology.

## Methodology

The methodology was a desk-based study that undertook an in-depth content analysis of 400 individual firm websites to construct a database of private wealth management providers, documenting the types of financial products which were offered to the HNWI client groups. To the best of the authors' knowledge this is the first such original compilation and analysis of retail private wealth providers in the financial literature that spans business studies, financial geography and the sociology of finance. In order to compile the database, six major types of service providers were categorized, as identified from the wealth management literature: banking (including retail, private and the wealth management arms (WMAs) of investment banks); asset management; insurance; accounting; legal; and high-street and internet-based specialists. For each type of category, lists of the predominant firms were obtained from various industry trade bodies and specialist intelligence sources, including: The British Bankers

Beginning with accountancy, the most frequently offered services by accountancy firms involved in wealth management in the UK were tax advice (21%), financial planning (15%), trust and/or estate management (9%), and help completing tax returns (8%) (Fig. 2). All of the leading UK, including global, accounting firms offered wealth management financial products to individual clients. For example, KPMG have a dedicated UK partnership team, Private Client KPMG, focused on personal taxation:

[W]e help individuals, trusts, and family companies with creative and constructive tax advice. Whether it's your tax return, running your business or passing on wealth we can help. We provide clear advice, tangible results and a transparent approach to fees.<sup>1</sup>

The key element of these products is ensuring that clients are 'tax efficient' in their personal and business activities. Servicing expatriates and non-domiciled residents are a particularly important clientele for accounting firms. For example, Rawlinson & Hunter highlight how international clients are exposed to complicated, cross-jurisdiction tax laws that can erode their wealth and they offer their services to minimize the tax exposure of clients to particular state taxes:

Whether you are moving into or out of the UK or any of the other jurisdictions in which we operate, we can advise you as to how to achieve your relocation in a tax efficient manner. The unrivalled experience of trusts and

✕ advise you on

Accountants can take account for a substantial part of the tax liability. Duncan & Hunter can facilitate the efficient and effective performance of an individual's financial affairs to minimize the tax exposure of the company.

Fig. 2 Pro

Source: [unclear]

Display full size

Meanwhile legal firms concentrated their activity within the HNWI and UHNWI ecologies with the two most frequently advertised services being the establishment of trusts (19%) and tax returns (19%) (Fig. 3).

These activities are consistent with the needs of high-net-worth individuals (HNWIs) and ultra-high-net-worth individuals (UHNWIs) who typically have complex financial portfolios and require specialized legal services. The establishment of trusts is a key service for HNWIs and UHNWIs, often used for asset protection, estate planning, and tax optimization. Tax returns are also a critical service for these individuals, given their complex income structures and the need for professional advice. The concentration of legal firm activity in these two categories suggests that legal firms are primarily serving the needs of high-net-worth individuals and ultra-high-net-worth individuals, rather than the broader population of middle-class or lower-income individuals. This is consistent with the findings of the study, which identified HNWI and UHNWI ecologies as the primary focus of legal firm activity.

likely to offer their services to 'old' money clients, by leveraging their historic brands, than the newer WMAs of investment banks, which rely on offering professional management to clients who have obtained their wealth through a liquidity event, or some other means of rapid wealth creation not linked to inheritance or the landed gentry. This, however, is not to say that private banks turn away new wealth while WMAs ignore 'old' wealth.

Importantly, WMAs of investment banks were created in some part to offer bespoke services, through their own business model, to their own employees, financial entrepreneurs, such as hedge fund managers, and employees of other financial service industries, whose remuneration packages (and number) increased astronomically from the late 1980s onwards in the context of relatively low personal taxation regimes in both the United Kingdom and United States. The diversification of investment banking into wealth management was also driven by the necessity to seek new income streams to counter the dependency and volatility of market trading revenue (MAUDE, [2006](#)). To put this potential financial elite wealth market into an empirical context for the UK, at the height of the market pre-financial crisis at year end 2007 the CENTRE FOR ECONOMICS AND BUSINESS RESEARCH (CEBR) ([2009a](#), [2009b](#)) estimated that £10.2 billion was paid out in bonuses to approximately 354 000 City-type jobs, which is a staggering increase of 162% from 2001, when a £3.9 billion bonus pot was paid out to an estimated 312 000 City-type jobs.

We work on the basis that most people want strategies that ‘keep their wealth’ rather than ‘make them wealthy’.[6](#)

Interestingly, the case of Coutts demonstrates how private banks are having to change their traditional services in order to compete with the more recently emerging wealth management industry, but Weatherbys highlights the requirement for some niche players to retain a focus on their traditional values and clientele.

Meanwhile, in terms of the WMAs of investment banks, J.P. Morgan, which has an office in London, appears to have developed its target market from a US perspective, focusing on the wealth of entrepreneurs in common with other wealth management departments. J.P. Morgan describes its business outlook as ‘the overriding objective of the investment practice is to help you achieve success’. Indeed, J.P. Morgan claims to be an advisor to 40% of the individuals on the Forbes Billionaire List and the Forbes 400 wealthiest Americans and targets its products to ‘new’ forms of wealth including business owners, corporate executives and entrepreneurs:

If you hold a significant equity stake in your company, an IPO, merger or corporate sale can unlock substantial personal wealth. ... We can help you prepare for a sale by valuing your interest in the business, weighing the pros and cons of various kinds of liquidity events.[7](#)

This paper has extended debates about financial elites and their role in processes of financialization by considering how such individuals not only shape such processes through their work in financial firms and related advanced producer services, but also are central, as consumers, to the development of new forms of retail financial services based around 'wealth management'. Using research on financial elites, financial services consumption and financial ecologies more generally together with original empirical research into the services provided by this industry, four important findings have emerged. First, the nature of financial elites in the United Kingdom, in common with developments in the United States, has changed markedly in recent years shifting from a dominance of 'old' forms of money based around family assets to 'new' forms of money associated with work in financial services and related producer services in which there is significant personal remuneration and a strong bonus culture. Indeed, these remuneration practices have proved to be remarkably resilient in the wake of the financial crisis. This distinction is important because this more recent form of 'new' money has been framed as being potentially highly profitable to a new set of retail financial service providers if it is managed and investment correctly within 'wealth management'. In this financial ecology, established providers in the form of longstanding private banks have faced increasing competition from new forms of financial services providers, most notably the wealth management divisions of investment banks that are in effect offering financial services to their own employees.

The rise and geographical spread of private banks has been studied and target markets are seen as

Secondly, the segmentation of the industry has developed into categories, the importance of which echoes the findings of the consultation.

the research revealed the changing international makeup of financial elites as they increasingly populate emerging markets in Asia and the Middle East, particularly in the wake of the financial crisis.

Third, and continuing the geographical outcomes of the research, more specifically the findings highlight the continued dominance of London and the South East of England as global clusters for the private wealth management industry, echoing earlier work on the effects of financial deregulation on the expansion of the City in the 1980s (LEYSHON and THRIFT, [1997](#)). Seventy-two per cent ( $n = 286$ ) of the private wealth management firms in the 400 firm database were headquartered in London in banking (private, wholesale and retail), asset management, insurance and professional services ('magic circle' law firms and the so-called 'Big Six' accounting firms), but less so in provincial centres like Edinburgh and Leeds. Indeed, the research reinforces London's reputation as being one of the world's leading centres for wealth and asset management ecologies, benefitting from its highly likely preponderance of 'home bias' in investor behaviour in domestic markets, ranked alongside New York, Singapore and Hong Kong (IFSL, [2009](#)).

Fourth, and conceptually, this paper has demonstrated the value of bringing into dialogue work on financial elites, financialization and retail finance. In so doing, the research identifies and specifies neglected financial ecologies that have developed to

elites in relation to retail financial ecologies. This paper has sought to initiate such a research agenda through the case of the UK.

## Acknowledgements

The authors would like to thank the Financial Services Research Forum and the University of Nottingham for funding this research from the project 'Scoping the Private Wealth Management of the High Net Worth and Mass Affluent Markets in the U.K.'s Financial Services Industry'. They also would like to express their thanks to the referees whose comments helped tighten the clarity of the conceptual arguments and to bring more empirical depth to the reportage of the findings.
