ABSTRACT

In light of an economic recession at a global scale, we should turn our attention toward sources of funding which, as leasing, present clear advantages to the more vulnerable small and medium-sized enterprises (SMEs). Applying logistic models on a sample of

4,425 SMEs, we analyze the determinants of leasing and the character of leasing in the use of leasing. The results show that, in the use of leasing, leasing is a regular activity, leasing is a regular activity, leasing is a regular activity with which...

Notes

¹ Information available at: <https://bit.ly/3afaNz8>.

² Due to data limitations, we are not able to analyze the level of lease financing used for the firms of our sample.

³ We recognize that one could wonder whether there are alternative definitions for our firm-specific variables, or even that additional firm characteristics could be included in our model. However, on this matter we are greatly restricted by the data available in the survey.

⁴ The survey was carried out at the end of 2005 and the beginning of 2006, and it gathers information about the use of leasing in the recent past, but without establishing a specific period. Therefore, we choose to measure the economic development variables and country-specific variables in 2003, rather than in 2004. Collecting these country variables from this time is a conservative decision that we undertake to avoid reverse causality (or simultaneity).

⁵ Due to data availability, the period analyzed is limited. It is not possible to include a longer period or more current data in our analysis. However, by studying the period just before the financial crisis and before the implementation of IFRS 16, we allow that future contributions might address the analysis of lease financing in SMEs and compare their results across different economic and financial scenarios.

⁶ Due to the existence of missing observations, we run a Heckman selection model in order to rule out the possibility that our results are affected by sampling bias. The dependent variable in the selection equation is answer, a dummy variable that equals one for firms entering our models, and zero for those firms with information about the
