Abstract

The relationship between trust and control in client-contractor interactions is explored, focusing on the control mechanisms used in a construction project. A longitudinal case study of a large laboratory construction project found that the client used a variety of control mechanisms to ensure that the contractor behaved trustworthily. Empirical data were gathered through interviews and non-participant observation. The results indicate that the use of control mechanisms is part of a complex and dynamic socially constructed process that requires ongoing discussion and evaluation, and to which informal control mechanisms are central. Business relationships built solely on trust are seemingly rare; even in trust-based collaborative settings, such as partnering arrangements; the contracting parties must pay attention to trust-nurturing actions.
