## Abstract

Estimation of the parameters of an exponential distribution based on record data has been treated by Samaniego and Whitaker [On estimating population characteristics from record-breaking observations, I. Parametric results, *Naval Res. Logist. Q.* 33 (1986), pp. 531-543] and Doostparast [A note on estimation based on record data, *Metrika* 69 (2009), pp. 69-80]. Recently, Doostparast and Balakrishnan [Optimal record-based statistical procedures for the two-parameter exponential distribution, *J. Statist. Comput. Simul.* 81(12) (2011), pp. 2003-2019] obtained optimal confidence intervals as well as uniformly most powerful tests for one- and two-sided hypotheses concerning location and scale parameters based on record data from a two-parameter exponential model. In this paper, we derive optimal statistical procedures including point and interval estimation as well as most powerful tests based on record data from a two-parameter Pareto model. For illustrative purpose, a data set on annual wages of a

sample of production-line workers in a large industrial firm is analysed using the proposed procedures.

Keywords:

generalized likelihood ratio test

invariant test

monotone likelihood ratio

shortest-width confidence interval

two-parameter Pareto model

uniformly most powerful test

## Acknowledgements

The authors are grateful to anonymous referees and the associate editor for their useful suggestions and comments on an earlier version of this manuscript, which resulted in a substantial improvement of this manuscript.
