# **Abstract**

A study was conducted to establish the occurrence and levels of contamination of aflatoxin M<sub>1</sub> (AFM1) in retail milk from Bogotá, Colombia. A total of 241 samples were analysed during 2004 and 2005. Samples were cleaned up by an immunoaffinity column and AFM1 was quantified by liquid chromatography with fluorescence detection. A total of 69.2 and 79.4% of the samples analysed during 2004 and 2005, respectively, were found to contain levels of AFM1 above  $10 \text{ ng l}^{-1}$ . Levels of contamination ranged from 10.7 to 213.0  $\text{ng I}^{-1}$  in 2004, and from 10.6 to 288.9  $\text{ng I}^{-1}$ in 2005. Despite the high incidence of AFM1 found in the milk samples analysed, all samples complied with current local regulations, which allow AFM1 content in milk up to  $400 \text{ ng l}^{-1}$ . However, due to the high incidence of AFM1 in milk found in the present study, it is recommended that a permanent surveillance programme be established for

milk consumed in Bogotá in order to prevent milk lots containing levels above the regulatory level entering the food chain.
