Abstract

In this article, we study the detection of multiple change points of parameters of generalized lambda distributions (GLD). The advantage of studying GLD is that the GLD family is broad and flexible. Compared to the other distributions, there are fewer restrictions on the distribution while fitting data. We combine the binary segmentation procedure together with the Schwarz information criterion (SIC) to search for all possible change points in the data. The method is applied on fibroblast cancer cell line data which is publicly available, and the change points are successfully located.

Acknowledgments

The authors wish to thank the two referees for their helpful comments, which helped the article's clarity and crispness. This work was partly done when A.K. Gupta was on FIL at Department of Biostatistics, University of Michigan, Ann Arbor, Michigan.
