ABSTRACT

Economists not only failed to anticipate the financial crisis; they may have contributed to it—with risk and derivatives models that, through spurious precision and untested theoretical assumptions, encouraged policy makers and market participants to see

Notes

1. Carmen Reinhart and Kenneth Rogoff (2008) argue that the current financial crisis differs little from a long chain of similar crises in developed and developing countries. We certainly share their view. The problem is that the received body of models in macro finance, to which these authors have prominently contributed, provides no room whatsoever for such recurrent boom and bust cycles. The literature has, therefore, been a major source of the illusory "this time it is different" view that the authors themselves criticize.

2. Indeed, few researchers explored the consequences of a breakdown of their assumptions, even though this was rather likely.

3. The historical emergence of the representative-agent paradigm is a mystery. Ironically, it appeared during the 1970s, after a period of intense discussion of the problem of aggregation in economics (which basically yielded negative results). The representative agent, however, appeared without similar methodological discussion. In the words of Deirdre McCloskey, "It became a rule in the conversation of some economists because Tom and Bob said so" (personal communication). Today, this convention has become so strong that many young economists wouldn't know of an alternative way to approach macroeconomic issues.

4. The reductionist conceptual approach of the representative agent is also remarkably different from the narrative of the "invisible hand," which also has the flavor of "more is different."

5. It is pretty obvious how the currently popular class of dynamic general-equilibrium models ... either by a dummy ... the economy ...
