## ABSTRACT

This study uses data from the 2013 Survey of Consumer Finances to investigate factors related to stock investment in individual retirement accounts and focuses on the role of gender and marital status in particular. This study finds that single women are less likely to own stocks and invest in fewer stocks in their IRAs. Personal characteristics, such as stock ownership in other financial assets, education level, and risk tolerance may play a role in stock investment in IRAs. However, the role of demographic factors remains unclear.

# Notes

<sup>1</sup> Typical investment options in DC plans are company stock and mutual funds, while investors can choose any type of investment in IRAs, except life insurance and collectibles.
