Abstract

It has been argued that the persistent mispricing of options, especially the overpricing of out-of-the-money put options, is a major reason for the often observed negative skewness in the risk-neutral price distributions of equity indices. This article investigates whether the Financial Times Stock Exchange 100 Shares index put options are overpriced compared with call options of the same moneyness and, if they are, whether this gives rise to profit opportunities in the market. By testing the weekly returns to

Notes

¹ The BS generates two types of error, firstly the implieds may not be accurate, and secondly the vega at those implieds may not be exact.

² The volatilities are mean-adjusted to control for the smile effect of the option-implied volatilities against moneyness. We use the mean across all the implieds of the day.
