Abstract

This article uses the 1995 and 2000 waves of the British Household Panel Survey to examine how a self-reported indicator of financial pressure is related to household finances and other characteristics. Using an ordered-logit model we find that the burden of debt is affected by the unsecured debt-income ratio, mortgage income gearing, financial wealth, health, ethnicity and marital status.

Notes

¹ The Insolvency Service estimates that only around 10% of bankrupt individuals have secured debt arising from mortgaged property. Similarly, around two-thirds of the debt clients of Citizens Advice Bureaux are tenants and so without mortgages (Citizens Advice, 2006).

² The BHPS is managed by the ESRC UK Longitudinal Studies Centre with the Institute for Social and Economic Research at the University of Essex. The BHPS is an annual national survey whose sample has remained broadly representative of the population. The BHPS sample excludes households located north of the Caledonian Canal in Scotland. The sample we use excludes new samples that were included in BHPS since 1997. Detailed information can be found in Brice et al. ([2002](#)).

³ See Berthoud and Kempson ([1992](#)), Cox et al. ([2002](#)), Kempson et al. ([2004](#)) and May et al. ([2004](#)) for household-level analyses of factors likely to affect financial distress among British households and Canner et al. ([1995](#)) for an analysis of the affordability of debt among US households. Brown et al. ([2005](#)) examine the relationship between debt and psychological distress using the BHPS.

⁴ Whitley et al. ([2004](#)) examine trends in credit card and mortgage arrears at the aggregate level.

⁵ The BHPS is an annual national survey whose sample has remained broadly representative of the population. The first wave corresponds to 1991 when 5500 households and 10 300 individuals (aged over 16 years) were included. The BHPS sample excludes households located north of the Caledonian Canal in Scotland. Our sample also excludes new samples that were included in BHPS since 1997.

⁸ We have also considered the case excluding households with at least one member reporting student loans and overdrafts in 2000. Since there is no information on the amount of debt by instrument, excluding households with overdrafts implies also excluding the debt that these borrowers may hold in other instruments. All figures are available upon request.

⁹ A fuller description of the distribution of unsecured debt and an econometric investigation of its determinants is in del-Río and Young ([2006](#)).

¹⁰ We use annual household income provided by BHPS which contains a conversion factor to allow for the effects of household size and composition. Income groups are percentiles of the income distribution for the sample in 1995. For 2000 the percentiles are updated using the Retail Price Index.

¹¹ Assuming there is not substantial variation across households. However, terms and interest rates depend largely on the type of unsecured debt.

¹² The results presented in this section are qualitatively similar to those obtained with BHPS weights. SEs do not vary if the estimation takes into account the fact that some households participate in both 1995 and 2000 surveys.

¹³ Thus, the probability of no problem for the reference group is given by $\exp(1.39)/[1+\exp(1.39)]$.

¹⁴ Average quoted credit card rates fell from 22.77% at end-September 1995 to 18.79% at end-September 2000. Over the same period unsecured loans of more than £10 000 fell from 17.12 to 11.7% and the standard variable rate on mortgages fell from 8.36 to 7.59%.

¹⁵ The fact that debt problems are generally increasing in the debt-income ratio

suggests that households with a high debt-income ratio are more likely to experience debt problems. In particular, the fact that the debt-income ratio has increased for a large and growing proportion of households suggests that the debt-income threshold for experiencing debt problems has moved a large and growing proportion of households into the debt-problem region. In particular, the fact that the debt-income ratio has increased for a large and growing proportion of households suggests that the debt-income threshold for experiencing debt problems has moved a large and growing proportion of households into the debt-problem region.
