## Abstract

Exchange Traded Funds (ETFs), including the innovative leveraged (long and inverse) types, and the ever more creative traditional versions, are accelerating in popularity as preferred investment and trading vehicles. Real estate, a major investment sector, has been made more accessible through these tools. This study investigates if the introduction of real estate ETFs is impacting the volatility of their underlying real estate stocks. Tests conclude that the introduction of leveraged (long and inverse) and traditional real estate and real estate related ETFs, linked to the Dow Jones US Real Estate and Financial Indices and the leveraged (long and inverse) ETFs, benchmarked to the Russell 1000 Financial Services Index, significantly increased the volatility in their component real estate stock prices. The leveraged ETFs tied to the Dow Jones US Real Estate and Financial Indices caused the highest volatility, approximately tripling the volatility in the underlying real estate securities. Traditional ETFs were second, causing slightly more than a 70% increase in volatility, while the leveraged ETFs linked to the Russell 1000 Financial Services Index, having induced a 50% increase in volatility, were third. The increased volatility could not be attributed to any other external event.

## Notes

<sup>1</sup> See ProShares press release, <http://www.proshares.com/resources/news/1830296.html>.

<sup>2</sup> See ETF Database, <http://etfdb.com/compare/volume/>.

<sup>3</sup> While a leveraged financial ETF, such as the ProShares Ultra Real Estate, is not a real estate security, it is a financial security that contained real estate securities.

<sup>4</sup> See De Long and Mankiw (2003) for a discussion of the impact of leverage on asset prices.

<sup>5</sup> See De Long and Mankiw (2003) for a discussion of the impact of leverage on asset prices.

<sup>6</sup> Some financial market observers and academics, however, believe that ETF and other basket security derivative-trading attracts hedgers, speculators and arbitrageurs into the markets, hence releasing new information through transactions and ultimately, helping the cash market to become more liquid and operate more efficiently. For example, see Karpoff ([1987](#)).

<sup>7</sup> See Deville ([2008](#)) for a more detailed explanation of the history and evolution of ETFs.

<sup>8</sup> See the Federal Reserve Board Regulations, <http://ecfr.gpoaccess.gov/cgi/t/text/text-idx?c=ecfr;sid=22f04e11d03377527cd5eabe69b90053;rgn=div8;view=text;node=12%3A3.0.1.1.1.0.1.12;idno=12;cc=ecfr>, which states ‘The required margin for each security position held in a margin account shall be. . . 50 percent of the current market value of the security or the percentage set by the regulatory authority where the trade occurs, whichever is greater’.

<sup>13</sup> See US SEC press release, <http://www.sec.gov/investor/pubs/leveragedetfs-alert.htm>.

<sup>14</sup> See Deville ([2008](#)) for a more detailed explanation of the ETF, in-kind, tax free, creation/redemption process.

<sup>15</sup> 66 securities were identified as real estate companies on both the IYF and IYR. One company was eliminated from these 66 securities for lack of complete data over the sample period. The study period, for each data sample group, covers a total of 128 trading days, which constitutes a 3 month trading window, pre- and post-ETF group introduction. This is consistent with Lin and Chiang ([2005](#)) who justified a short sample period as best for minimizing the likelihood of other uncontrolled factors confounding the findings.

<sup>16</sup> 78 securities were identified as real estate companies on both the IYF and IYR. This entire sample, without eliminations, was employed in the test, since data was available on all 78 securities over the sample period.

<sup>17</sup> The Markov-switching regime accounts for the non-normality of the ETF benchmark indices by utilizing a mixture-of-normal approach. For more details, see Ammann and Verhofen ([2006](#)).

<sup>18</sup> It should be noted that algorithm is converged for 270 out of the 283 stocks (94.4%) examined in Groups 1 to 4.
