Research Limitations: The analysis has been developed from the retail perspective. We suggest that future research focus on the retailer's and the provider's perspectives.

Practical Implications: In the context of SCM, the competitive advantages achieved through IT use derive from a better network of relationships between the firms involved as a result of greater information quality and information sharing. Specific use of ITs stimulates greater information sharing between retailer and provider and thus greater satisfaction and better perceived performance of the retailer in the relationship with the provider. However, the effect of IT use on information sharing occurs only through the quality of the information shared.

Originality/Value: The study shows that information quality is an antecedent of information sharing and that both information quality and information sharing act as necessary conditions for improving the retailer's perceived performance in the relationship with the provider. This article develops a measurement scale to evaluate the intensity of IT use. Finally, the research confirms that firm performance can be modeled as a second-level latent variable composed of three different dimensions (economic benefits, marketing benefits, and adaptation benefits).

Keywords: information technology supply chain management performance relationship information quality information sharing
