Show Purpose

the regularity of the varve thickness and the distinctness of varve boundaries, and was not influenced by the varve thickness itself. Even though manual and semiautomated varve counting show similar results of the total amount of varves, with the difference of only 0.56%, the comparison between those two methods in intervals of 200 years indicates potential problems, especially for sections with complex lamination and turbidites. We found that semiautomatic varve counting overestimated the varve boundaries in sections with erosive turbidites. Our results confirm the importance of validation of varve chronologies by independent dating methods and caution in relying on automated methods.

Keywords: lacustrine sediments biogenic varves varve chronology automatic varve counting radiometric dating age-depth model north-eastern Poland

## Acknowledgements

This research was supported by the Polish Ministry of Science and Higher Education grants to M. Kinder (N N306 009337) and to N. Piotrowska (N N306 291639). It is a contribution to the bilateral scientific programme “Northern Polish Lake Research” (NORPOLAR), a Polish-German research initiative funded by the Deutsche Forschungsgemeinschaft and the Polish Ministry of Science and Higher Education. The authors would also like to acknowledge the support and cooperation of the Suwałki Landscape Park. This paper stems from a presentation at the 3rd PAGES (Past Global Changes) German
