Abstract

This study compares the efficacy of the Relative Strength Index (RSI) vis-à-vis the Moving Average (MA) trading rules on the daily exchange rates of six currencies. The results in the sample period 1970-1999 show that the RSI trading rule is more profitable than the MA trading rule, and the RSI trading rule is more robust to exchange rate interventions. It is also found that the RSI trading rule is more profitable than the MA trading rule in the immaterial exchange rate market.
