Abstract

This article studies a long-run relationship between the labour-force participation rate and the unemployment rate in Japan. By using cointegration analysis, we demonstrate that there exists a long-run relationship between the two variables for male workers but not for female workers. Furthermore, using labour-force data by age group, we find the added-worker effect for young males and the discouraged-worker effect for middle-aged and old male groups.

¹ The unemployment invariance hypothesis suggests that the long-run unemployment rate is independent of the labour force. While Layard et al. ([1991](#)) provided evidence in support of this hypothesis, Karanassou and Snower ([2004](#)) provided a critique of it.

² The data for the sample period are released from the website of the Japanese Ministry of Internal Affairs and Communications, <http://www.stat.go.jp/>.
