## We Care About Your Privacy

We and our 899 partners store and access personal data, like browsing data or unique identifiers, on your device. Selecting "I Accept" enables tracking technologies to support the purposes shown under "we and our partners process data to provide," whereas selecting "Reject All" or withdrawing your consent will disable them. If trackers are disabled, some content and ads you see may not be as relevant to you. You can resurface this menu to change your choices or withdraw consent at any time by clicking the ["privacy preferences"] link on the bottom of the webpage [or the floating icon on the bottom-left of the webpage, if applicable]. Your choices will have effect within our Website. For more details, refer to our Privacy Policy. [Here](#)

## Acknowledgements

I am grateful to Terra McKinnish and Elizabeth Brainerd as well as participants at the 2012 AEA meetings for their feedback on the preliminary results. Any remaining errors are my own.

## Notes

- <sup>1</sup> Documentation and data are available at <http://www.ennvih-mxfls.org/>
- <sup>2</sup> Arguably, a bivariate probit model with fixed effects would better account for the binary nature of the dependent variable and independent variable of interest. However, due to the large number of household fixed effects, estimation is computationally difficult. Results from logit and conditional logit estimation are qualitatively similar to those reported here.

<sup>3</sup> In this case, the dependent variable is the number of children in the household. The independent variable of interest is the head of the household.
