## Abstract

This article provides a comparative analysis of the performance of the credit growth variable compared to the credit-to-GDP ratio as an early warning indicator of banking crises. We find that both variables correctly detect expansive credit growth leading to financial stability problems. However, the timing of the early warning indicators is closer in keeping with cycle changes when the credit growth variable is used. The results obtained are important to design prudential policies aimed at preventively monitoring and fostering banking sector stability and, particularly to manage the countercyclical capital buffer envisaged in the Basel III package.

Keywords:

financial stability

credit procyclicality

countercyclical capital buffers

Basel III

## Acknowledgements

The authors thank Jesús Saurina, Agustín Maravall and Iñaki Caminos for useful comments and discussions. All remaining errors are the responsibility of the authors.

## Notes

- <sup>1</sup> Drehmann and Gambacorta ([2012](#)) simulate the effects of this countercyclical capital butter in the bank credit supply.
- <sup>2</sup> This article sets out the results for , typical value used for annual data. On the other hand, we have tested the resilience of the results for alternative values of taking into consideration the research of Drehmann et al. ([2010](#)), Borio and Drehmann ([2009](#)), Maravall and Del Río ([2007](#)), Ravn and Uhlig ([2002](#)) and Gourinchas et al. ([2001](#)). Thus, for all the verified values ( , results obtained are consistent with those presented.
