Abstract

Using a three-factor stochastic real option model framework, this paper examines the effects of abandonment on the investment decision. Abandonment is classified according to whether the opportunity arises for an active operating asset postinvestment, or for holding the project opportunity pre-investment. Separate analytical models are developed for the alternative forms of abandonment optionality. Numerical

Acknowledgements

We thank the two anonymous referees, Michela Altieri (the discussant), Michael Flanagan, Paulo Pereira, Artur Rodrigues and other participants at the PFN Vilamoura 2014 conference for comments on earlier versions.

Disclosure statement

No potential conflict of interest was reported by the authors.

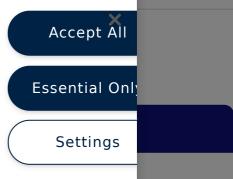

Notes

- 1. Some authors assume $\theta_{\psi} = r \alpha_{\psi}$, without a risk adjustment. It is likely that these drifts may be related for some types of equipment such as cars, but not perhaps for ships, but we ignore these possibilities.
- 2. In our base case, we assume zero correlation between V, K and X, that is X may not be reflective of real option investment values. This assumption is relaxed in Figures 5 and 10.
- 3. A similar result is obtained for the investment cost volatility.
- 4. An algebraic explanation is available from the authors.
- 5. All of these numerical results are available from the authors.
