Abstract

Instrumented indentation and tensile tests were performed on free standing Cu/Ag multilayer thin films with layer thicknesses in the range 0.85–900 nm. The effect of layer thickness can be described by a Hall–Petch relationship. The work-hardening rate in the tensile test depends on layer thickness, which indicates that the interfaces create storage sites for dislocations and follows an inverse power law.

Acknowledgments

Los Alamos National Laboratory and NSERC Canada are acknowledged for financial support. The work at Harvard was supported by the Harvard Materials Research Science

and Engineering Center under contract number DMR 98-09363. H.H. acknowledges support from an AlliedSignal predoctoral fellowship.
