## Abstract

Recently, finance literature has turned to non-economic factors such as investor sentiment as possible determinants of asset prices. Using mutual fund data, I calculate a new sentiment measure, a perceived loss index. The advantage of the loss index is that it can determine perceived risk for different categories of equities, including market capitalization, style and sector. Results provide evidence that the perceived loss index outperforms all other sentiment and systematic risk measures in predicting future medium-term returns.

# ACKNOWLEDGMENTS

I am grateful to Dan Friedman for invaluable advice. I am also grateful for the suggestions from seminars at Worcester Polytec, San Francisco State University and the Federal Reserve Bank of Cleveland. I am thankful to University of California Pacific Rim Grant. I retain sole responsibility for remaining idiosyncrasies and errors.

## Notes

1. See Fischer and Statman [2000] and Baker and Wurgler [2006].
2. In the regressions below I use PLI calculated with various half lives. The PLI with a half life of one year returned the highest R-square.
3. See Appendix for a more detailed explanation.
4. More specifically, this index uses all funds classified as growth, value, core, small cap, mid cap, large cap, small growth, small value, small core, mid growth, mid value, mid core, large growth, large value and large core.
5. Due to the recent financial crisis I have updated the figures to include the level of the index up until January 1, 2009.
6. The data are taken from Kenneth French's website,  
[http://mba.tuck.dartmouth.edu/pages/faculty/ken.french/data\\_library.html](http://mba.tuck.dartmouth.edu/pages/faculty/ken.french/data_library.html).
7. The MSCI index levels I use include the US Investable Market 2500, Small Cap Value, Small Cap Growth, Large Cap Value, Large Cap Growth, Growth, Value, Small Cap 1750, Large Cap 300, and MSCI REIT Index.

8. For grader in time,
