constructs ($r = 0.51-0.68$). All KIDSCREEN-52 dimensions showed a gradient according to socioeconomic status and most dimensions showed a gradient according to psychosomatic health complaints. The first results demonstrate that the KIDSCREEN-52 questionnaire is a promising cross-cultural measure of health-related quality-of-life assessment for children and adolescents in Europe.

Keywords: children and adolescents, crosscultural comparison, health-related quality of life, questionnaire development, reliability, validity
