We Care About Your Privacy

We and our 855 partners store and access personal data, like browsing data or unique identifiers, on your device. Selecting "I Accept" enables tracking technologies to support the purposes shown under "we and our partners process data to provide," whereas selecting "Reject All" or withdrawing your consent will disable them. If trackers are disabled, some content and ads you see may not be as relevant to you. You can resurface this menu to change your choices or withdraw consent at any time by clicking the ["privacy preferences"] link on the bottom of the webpage [or the floating icon on the bottom-left of the webpage, if applicable]. Your choices will have effect within our Website. For more details, refer to our Privacy Policy. [Here](#)

It is easier to banish risk seeking from our theory than from our behavior. Although mean-variance portfolio theory has become the basis of standard financial theory, investors continue to trade stocks and play the lottery.

Lottery playing and stock trading are puzzles in standard financial theory because they are negative-sum games—games that combine high risk with negative expected returns. Lottery playing is a negative-sum game because the lottery authority keeps some of the money. Stock trading (as opposed to buying and holding) is a negative-sum game because brokers and market makers keep some of the money. So, why do people play? First, perhaps all lottery players and stock traders think they are above average, likely to win even in a negative-sum game. Second, perhaps lottery players simply like to play and stock traders simply like to trade. Third, perhaps lottery players play and stock traders trade because they aspire to move up in life, from the working class to the middle or the upper class. I discuss these three possible reasons for lottery playing and stock trading:

- We think we're above average. According to a 2001 survey of individual investors, the investors expected the stock market to provide a mean 10.3 percent return over the following 12 months, but they expected their own portfolios to provide a mean return of 11.7 percent. In other words, investors expected, on average, to be above average. The unrealistic optimism that people display in the lottery and trading arenas. People are over-optimistic about their own financial performance, just as parents are over-optimistic about their children. We like to play. Lottery playing is a “flow” activity that provides a “flow” of excitement. People who trade stocks for the excitement of trading. We like to trade. Stock trading is a “flow” activity that provides a “flow” of excitement. People who trade stocks for the excitement of trading.
- We like to trade. Stock trading is a “flow” activity that provides a “flow” of excitement. People who trade stocks for the excitement of trading.
- We hope to move up. Lottery playing and stock trading are “flow” activities that provide a “flow” of excitement. People who play the lottery and trade stocks for the excitement of trading. For other people, lottery playing and stock trading are “flow” activities that provide a “flow” of excitement. People who play the lottery and trade stocks for the excitement of trading.

we are off to work in the morning and when we come home tired. . . . Isn't it beautiful?"

The insurance–lottery framework is a keystone in behavioral portfolio theory. In the simple version of the theory, people have two goals—a “downside protection” goal and an “upside potential” goal. The prototypical purchase for downside protection is an equity participation note, which ensures that investors will at least get their money back. The prototypical purchase for upside potential is a lottery ticket. Lottery buyers are likely to lose their money, but they have a chance to obtain even multimillion dollar levels of upside.

I thank Peter Bernstein, Charles Ellis, Ramie Fernandez, Marty Fridson, Harry Markowitz, Bill Sharpe, Hersh Shefrin, Richard Taffler, and Jason Zweig for their help, and I acknowledge support from the Dean Witter Foundation.
