The reasons for the superior performance of value investing, however, are controversial. Some researchers attribute the higher returns to the higher risk of value stocks; other researchers contend that the rewards to value investing stem from cognitive biases underlying investor behavior and the agency costs of delegated investment management.

We summarize and bring up to date the academic empirical research on value and growth investing. The bulk of current research stopped short of the late 1990s, a period that was not kind to value stocks. When the data through 2001 are considered, however, value investing still outperforms growth investing. During the 1990s, the performance of growth stocks rocketed, prompting speculation that value investors were an endangered species. The careful examination of the data that we present suggests that the differences among equity asset classes with respect to their performance in the late 1990s were not grounded in fundamental patterns of profitability growth. A more plausible interpretation is that investor sentiment reached exaggerated levels of optimism about the prospects for such “growth” opportunities as telecommunications, media, and technology stocks. This interpretation is consistent with evidence that investors tend to focus on past growth and extrapolate too far into the future. Furthermore, the sharp rise and decline in recent years of these growth-oriented stocks calls into question the argument that growth stocks are the less risky investments. In fact, the superior returns on value stocks for the overall period were not accompanied by
