Radiation Effects on Rat Brain

Metalloporphyrin antioxidants ameliorate normal tissue radiation damage in rat brain

induced apoptosis in primary neuronal cultures and increased clonogenic survival of irradiated rat glioma C6 cells, but had no discernible effect on radiation-induced DNA double-strand breaks. MPA, a low molecular weight SOD mimic, significantly increased mitochondrial SOD activity in C6 cells, but not total cellular SOD activity. MPA upregulated C6 expression of heme-oxygenase 1 (HO-1), an endogenous radioprotectant, but had no effect on HO-1 levels in human astrocytoma U-251 cells, human prostatic carcinoma LNCaP cells, or primary rat brain microvascular endothelial cells in vitro, nor on brain tissue HO-1 expression levels in vivo.

Conclusions: Metalloporphyrin antioxidants merit further exploration as adjunctive radioprotectants for cranial radiotherapy/radiosurgery applications, although the potential for tumour protection must be carefully considered.

Q Keywords: antioxidant radioprotection normal tissue complication probability pre-conditioning

Acknowledgements

Manganese (III) meso-tetrakis (diethyl-2-5-imidazole) porphyrin (AEOL-10150) was supplied by Incara Pharmaceuticals (Durham, NC, USA).

Declaration of interest: One of the authors JDC is a patent holder for the compound manganese (III) meso-tetrakis (diethyl-2-5-imidazole) porphyrin used in this study. None of the other authors report any conflicts of interest.

A review of radiation countermeasures focusing on injury-specific medicinals and regulatory approval status: part II. Countermeasures for limited indications, internalized radionuclides, emesis, late effects, and agents demonstrating efficacy in large animals with or without FDA IND status.
