Communication

Developing Countries and the Future of the Kyoto Protocol

FRANK JOTZO*

(Australian National University)

Fundamental Dilemmas

Developing countries are home to five out of the six billion people, but historically have contributed only around one-quarter of the greenhouse gases from energy consumption now accumulated in the atmosphere. Energy use and emissions per person in developing countries on average are still only around one-quarter of those in industrialized countries. Resources for economic restructuring are much more limited in developing countries, with average per capita incomes less than one-quarter of those in the industrialized world.¹ Moreover, adverse impacts of climate change are likely to affect developing countries particularly badly.

A compelling ethical case can thus be made that poorer countries should be free to develop economically without greenhouse gas constraints, while rich countries—which after all have built much of their wealth through energy-intensive industrialization—should go ahead and reduce their emissions in the global interest. Poorer countries insist on their ‘right to develop’, and greenhouse gas constraints (along with other environmental policies) are often seen as obstacles to development. As Adil Najam observed,

The principal and unchanged interest of the South has remained *development* and a better quality of life for its people; its principal fear, that the North is using environmental issues as an excuse to pull up the development ladder behind it.²

But limiting global warming to avoid the worst of the potential negative impacts will require a drastic change in the emissions trajectories in both rich and poor countries, so developing countries will need to take part in the effort. Developing countries already account for around half of annual global greenhouse gas emissions, and future emissions growth will come mainly from current developing countries.

Engaging key developing countries is also vital to help make greenhouse gas control politically acceptable in industrialized countries. There is little prospect of the US taking

Prime Minister's speech on climate change, London (14 September 2004), < <http://www.number-10.gov.uk/output/page6333.asp> > (accessed 15 September 2004).

The UK and Swedish governments have called for EU commitments to cut emissions by 60 per cent by 2050 compared with 1990, while the German government proposed a cut of 40 per cent by 2020, if an overall cut for the European Union of 30 per cent by 2020 can be agreed.

Bhandari, A. Kassenberg, E. L. La Rovere and A. Rahman, South-North Dialogue on Equity in the Greenhouse. A Proposal for an Adequate and Equitable

Global Climate Agreement (Wuppertal, Germany: Wuppertal Institute and Cape Town, South Africa: Energy Research Centre, 2004). See also the position paper by the international climate NGO network Climate Action Network, *A Viable Global Framework for Preventing Dangerous Climate Change* (Milan: Climate Action Network International, 2003); and a number of proposals originating from research institutes, such as that by Axel Michaelowa, Sonja Butzengeiger and Martina Jung, *Graduation and Deepening: An Ambitious Post-2012 Climate Policy Scenario* (Hamburg Institute of International Economics [HWWA], 2003).

Under an intensity target, emissions permits are linked to GDP growth, thereby compensating for fluctuations that stem from changes in economic activity. Under non-binding targets, some developing countries would be given the option to walk away from their commitments without penalty if compliance turned out to be difficult or costly. See Cedric Philibert and Jonathan Pershing, 'Considering the Options: Climate Targets for All Countries', *Climate Policy*, 1 (2001), pp. 211-227; and Frank Jotzo and John C.V. Pezzey, 'Flexible Greenhouse Targets under Uncertainty', manuscript, Australian National University, Canberra (2004).
