# **ABSTRACT**

A new risk measure, lambda value at risk ( $\Lambda VaR$ ), has been recently proposed as a generalization of value at risk (VaR).  $\Lambda VaR$  appears attractive for its potential ability to solve several problems of VaR. This paper provides the first study on the backtesting of  $\Lambda VaR$ . We propose three nonparametric tests which exploit different features. Two tests are based on simple results of probability theory. One test is unilateral and is more suitable for small samples of observations. A second test is bilateral and provides an asymptotic result. A third test is based on simulations and allows for a more accurate comparison among  $\Lambda VaRs$  computed with different assumptions on the asset return distribution. Finally, we perform a backtesting exercise that confirms a higher performance of  $\Lambda VaR$  in respect to VaR especially when it is estimated with distributions that better capture tail behavior.
