Asian options on the harmonic average

JAN VECER*

Frankfurt School of Finance and Management, Sonnemannstrasse 9–11, Frankfurt, 60314, Germany

(Received 23 January 2013; accepted 12 September 2013)

1. Introduction

The contracts written on the harmonic average of the underlying price are quite popular in the foreign exchange market. If X denotes the foreign currency and Y denotes the domestic currency, the pay-off of the contract is a function of a price of an asset H which is defined as

$$H(T) = \left[\int_0^T [X_Y(t)]^{-1} \eta(t) dt \right]^{-1} Y(T) \left[\frac{1}{\int_0^T X_Y(t) \eta(t) dt} \right] Y(T).$$

The harmonic average resembles a quanto option: the price $YX(t)$ is monitored with respect to the foreign currency X , but the pay-off is settled in the domestic currency Y . Although the pricing problem appears to be rather complex, it can be ultimately simplified to a partial differential equation in one spatial variable after a numeraire change and using the time reversal argument.

Let us first introduce notation that we use more generally in this article. By X or Y we mean an asset rather than the price of the asset. One can think about X or Y as names of the assets that have no numerical meaning. We write $X(t)$ or $Y(t)$

in the situation when the asset is required at time t for trading, hedging or settling a financial contract. The price of an asset is a pairwise relationship of two assets, which we denote by $X_Y(t)$: the number of assets Y required to obtain a unit of an asset X . The asset Y is known as a reference asset or as a numeraire. We will also use the relationship

$$X_Z(t) = X_Y(t) \cdot Y_Z(t),$$

known as the change of numeraire formula. We will write $X(t) = Y(t)$ in terms of the assets if X and Y have the same price (numeraire independent result). Similarly $X(t) > Y(t)$ means that the asset X has a larger price than the asset Y .

Given two assets X and Y , several types of averages can be considered:

$$\text{Arithmetic: } A(T) = \left[\int_0^T X_Y(t) \eta(t) dt \right] Y(T), \quad (1.1)$$

$$\text{Geometric: } G(T) = \left[\exp \left(\int_0^T \log[X_Y(t)] \eta(t) dt \right) \right] Y(T), \quad (1.2)$$
